Core Problem

Caring for Alzheimer's patients is challenging due to memory loss, disorientation, and safety risks. Traditional methods often lack real-time support for medication adherence, emergency alerts, and patient tracking. There is a pressing need for an integrated solution offering features like medication reminders, face recognition, geofencing, and AI-powered caregiver assistance to enhance care and improve patient well-being.

Objective

The application supports Alzheimer's patients through medication reminders, real-time location tracking, and emergency alerts. It enhances safety, promotes independence, and reduces caregiver stress — all through a simple, user-friendly interface. Caregivers receive timely notifications and tools that enable more proactive, informed care.

Methodology

We followed the waterfall methodology to guide project development, using a client-server architecture to ensure structured progress, clear communication, and reliable system performance.

Technologies

Beneficiaries

The primary beneficiaries of RE MIND are Alzheimer's patients and their caregivers. The system enhances patient safety through reminders and tracking, while supporting caregivers with real-time monitoring and emergency

Deliverable

The deliverables include two mobile apps: one for patients to manage reminders and safety features, and another for caregivers to monitor and support them in real time.
